EDUCATION

- **Northwestern University**
  M.S., Ph.D. candidate in Electrical Engineering, advised by Prof. Ying Wu
  Evanston, IL, United States
  Sep. 2019 - June 2024 (Expected)

- **Sun Yat-sen University**
  M.S. in Computer Science, advised by Prof. Long Chen
  Guangzhou, China
  Sep. 2017 - June 2019

- **Sun Yat-sen University**
  B.E. in Computer Science
  Guangzhou, China
  Sep. 2013 - June 2017

RESEARCH INTERESTS

- **Active vision**
  Involving intelligent control strategies into the visual recognition process to handle different recognition challenges.

- **Uncertainty estimation for classification models**
  Enabling classification models to say "I do not know", especially for robots in open-world scenarios.

- **Vision-language foundation models**
  Investigating and employing vision-language foundation models for embodied perception and question answering.

RECENT RESEARCH PROJECTS

- **Open-Vocabulary Active Recognition**
  Developing open-vocabulary active recognition agents in simulators.
  Sep. 2023 - Present

  - **Motivations:** Most existing active recognition research relies on closed-set toy datasets, such as unoccluded 3D CAD models. Challenges in realistic active recognition, including challenging recognition conditions and open categories, have largely been overlooked, even though they are prevalent in open environments.

- - **Details:** a. Defined the open-vocabulary active recognition task, an area not covered in existing embodied perception challenges. Collecting and organizing the datasets for active recognition based on different recognition difficulty levels. b. Created an open-vocabulary recognition agent capable of actively exploring its environment to recognize open-class objects using large language models.
- **Joint Learning of Recognizer and Policy in Active Recognition** Jan. 2022 - June 2022
  Investigating the challenges in concurrently training both vision and policy modules.
  - **Motivations:** Joint learning of two modules, i.e., the recognition module and the policy, could lead to unintended consequences. The policy only visits views that the recognizer is already sufficiently trained to obtain rewards, which hurts its generalization ability during testing.
  - **Details:** The proposed method introduces an adversarial policy to compete with the major recognition policy. During training, the adversarial policy continuously perturbs the agent for more effective and thorough training of both the recognizer and the policy module.
- **Controllable Image Generation for Articulated Objects (Human Body)** Sep. 2021 - Dec. 2021
  Designing a 3D-aware NeRF-based model for articulated objects, primarily the human body.
  - **Motivations:** a. Compared to human image generation methods operating in the 2D domain, synthesizing 3D human models and then projecting to 2D could give a better attribute disentanglement. b. Manipulating articulated objects in 3D provides superior temporal consistency in generated videos.
  - **Details:** The proposed method disentangles the articulated body into a composition model of rigid parts. The movement of each rigid part is detached from a canonical representation. Regid parts are reconstructed with randomness-injected NeRF models. This method is trainable solely on 2D image collections.
- **Active Recognition with Limited Training Samples and Continual Learning** June 2021 - Dec. 2021
  Handling realistic challenges of active recognition during the agent's exploration.
  - **Motivations:** a. Agents may encounter novel objects during exploration. To recognize these, the agent must expand its knowledge base, requiring lifelong or continual learning. b. Newly acquired object categories often lack extensive labeled data. How can one devise active recognition strategies under limited data settings?
  - **Details:** a. Developed a rehearsal-based active recognition strategy using limited exemplar memory. Forgetting is mitigated using distillation loss on stored exemplars. A center-based classification approach addresses the challenge of limited training samples. b. Experiments span both object and scene recognition.

WORK EXPERIENCE

- **Amazon Robotics** Seattle, WA, United States
  Applied Scientist Intern June 2023 - Sep. 2023
  - **Topic:** Monocular surface normal estimation. Item placement stability analysis for fulfillment centers.
  - **Details:** Leverage advanced deep vision models to interpret and reconstruct scene structures from a singular image, enhancing robotic guidance for stable item placements.
- **Wormpex AI Research** Bellevue, WA, United States
  Research Intern, Mentor: Dr. Bo Liu, Dr. Haoxiang Li, and Dr. Gang Hua June 2022 - Sep. 2022
  - **Topic:** Uncertainty quantification for deep visual recognition.
  - **Details:** a. Reviewing recent studies on recent deep uncertainty estimations, including Baysian-based and evidence-based methods. Conducting various experiments on recent uncertainty estimation methods and also relevant applications, like active learning and open-set recognition. b. Propose an approach to estimate ignorance and confusion at the same time. The method is established under the Depmster-Shafer theory and subjective logic. Opinions are then developed by doing evidence combinations.
- **Yosion Analytics** Chicago, IL, United States
  Research Intern, Mentor: Dr. Nan Jiang June 2020 - Sep. 2020
  - **Topic:** Autonomous forklift in a human-machine co-working environment.
  - **Details:** a. Developing a camera-based pallet recognition and localization system for precise autonomous pallet lifting. b. Developing a vision-based empty pallet space detection system that could be used under changing lighting conditions. The system runs on a Raspberry Pi in real time.
- **DJI** Shenzhen, China
  Visual Engineer Intern June 2016 - Sep. 2016

SELECTED SCHOLARSHIPS & HONORS

- **Northwestern University Murphy Fellowship** 2019-2020
- **Best Student Paper, IEEE Intelligent Vehicle Symposium** 2018

ACADEMIC SERVICES

- **Invited Conference & Journal Reviewer** CVPR, ICCV, ECCV, WACV, ICRA, IROS, IV, T-PAMI, IJCV, etc.
